

EnduraBol®

HIGH IODINE

Cutting-Edge Bolus Technology

Single construction

Single point erosion

Active for up to 180 days

Manufactured
in the UK

Trace Elements

Iodine

Selenium

Cobalt

Zinc

Copper

Manganese

Vitamins

Vitamin E

Vitamin A

Vitamin D₃

Manufactured by
RUMBOL
PRODUCTS LTD

How the Bolus Works

Once each bolus reaches a cow's reticulum, the top of the resin coating begins to chip away exposing the consistent surface area. Here, the trace elements and vitamins are held in a matrix structure that allows them to be released slowly and consistently. When the resin coating reaches the bottom of the bolus, it exposes the iron weight, which is then dissolved, leaving no residue or waste.

Trace Elements

I Iodine
Essential for hormone production. Key for fertility, aiding foetal growth and development. Also supports a healthy immune system.

Zn Zinc
Aids in fertility, iron absorption and skeletal development. Also enhances coat condition and pigmentation.

Se Selenium
Reduces retained cleansings and improves calf vigour. Helps support a healthy immune system and acts as an antioxidant in conjunction with vitamin E.

Cu Copper
Supports fertility, muscle development and coat condition. Enhances skeletal development and maximises production.

Co Cobalt
Essential for milk production and suckling calves. Improves conception and growth rates, also required for vitamin B12 production.

Mn Manganese
Aids fertility and development of reproductive systems. Essential for enzyme systems, growth rates and skeletal development.

Vitamins

E Vitamin E
Key for good fertility, and reduced retained cleansings. Supports a healthy immune system and maximises muscle growth.

D₃ Vitamin D₃
Aids in calcium and phosphorus absorption. Helps reduce grass staggers while supporting the immune system and energy metabolism.

A Vitamin A
Helps improve conception rates. Supports vision and the immune system, while assisting growth and development.

Twin cristic resin coating controls the release rate, ensuring a sustained and constant supply of nutrients

Inert dissolvable iron weight ensures bolus remains in the reticulum

Single point erosion from a constant surface area

Trace element and vitamin matrix erodes, and nutrients are released to the animal

What Makes EnduraBol® Unique

Single Construction

Ensures there is no risk of the bolus breaking apart and super-dosing the animal

Single Point Erosion

Provides a consistent daily supply of nutrients

Wax Cap

Protects the bolus from eroding before it reaches the reticulum

Active for up to 180 Days

Providing the animal with all essential micronutrients for up to six months

Three Vitamins

A unique cold pressure treatment process guarantees vitamins are not denatured during production

Six Trace Elements

Including manganese and zinc, which are not normally found in other boluses

Ideal For:

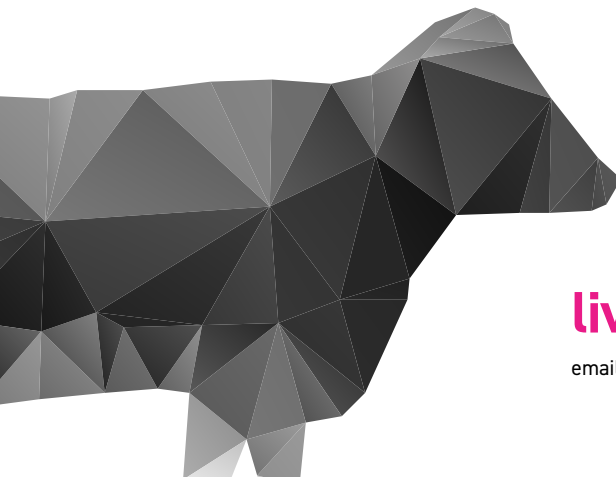

Pre-calving

Cattle With Known Iodine Deficiency

Heifer Rearing

Suitability

CATTLE > 150KG

Up to 6 Months Supplementation

10 COW SUPPLY

Net Weight 2.14kg
20x Bolus
